

NAME

Module::Build::Base - Default methods for Module::Build

SYNOPSIS

Please see the Module::Build documentation.

DESCRIPTION

The `Module::Build::Base` module defines the core functionality of `Module::Build`. Its methods may be overridden by any of the platform-dependent modules in the `Module::Build::Platform::` namespace, but the intention here is to make this base module as platform-neutral as possible. Nicely enough, Perl has several core tools available in the `File::` namespace for doing this, so the task isn't very difficult.

Please see the `Module::Build` documentation for more details.
