

NAME

cpan2dist - The CPANPLUS distribution creator

DESCRIPTION

This script will create distributions of CPAN modules of the format you specify, including its prerequisites. These packages can then be installed using the corresponding package manager for the format.

Note, you can also do this interactively from the default shell, `CPANPLUS::Shell::Default`. See the `CPANPLUS::Dist` documentation, as well as the documentation of your format of choice for any format specific documentation.

USAGE

Built-In Filter Lists

Some modules you'd rather not package. Some because they are part of core-perl and you don't want a new package. Some because they won't build on your system. Some because your package manager of choice already packages them for you.

There may be a myriad of reasons. You can use the `--ignore` and `--ban` options for this, but we provide some built-in lists that catch common cases. You can use these built-in lists if you like, or supply your own if need be.

Built-In Ignore List

You can use this list of regexes to ignore modules matching to be listed as prerequisites of a package. Particularly useful if they are bundled with core-perl anyway and they have known issues building.

Toggle it by supplying the `--default-ignorelist` option.

Built-In Ban list

You can use this list of regexes to disable building of these modules altogether.

Toggle it by supplying the `--default-banlist` option.
